

● prefers block A

● prefers block B

$K = 5$ sampled each round (not the whole network)

round 1

validator v

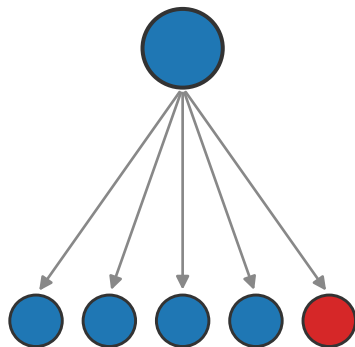

query K random peers

sample: 3/5 blue
counter $\rightarrow 1$

round 2

validator v

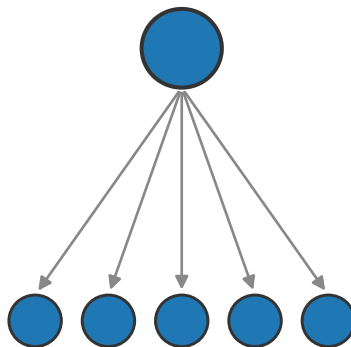

query K random peers

sample: 4/5 blue
counter $\rightarrow 2$

...

validator v

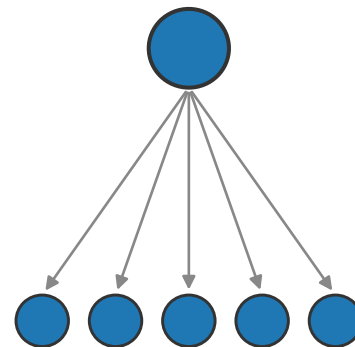

query K random peers

sample: 5/5 blue
counter $\rightarrow \dots$

round β

validator v

query K random peers

sample: 5/5 blue
counter $\rightarrow \beta$

counter reaches $\beta \rightarrow$ **ACCEPT**
probabilistic finality, $\epsilon \leq (1 - \alpha_c/K)^\beta$
